

Feedback from mentor

1. The system should handle the error message. If an error occurs, system should not just crash, it should show some information about the error. If the system has errors during selling the order, the system should let the user know whether the order get successfully sold or not.
2. In the submit order page, the system should show user whether they are sell or not. What are they selling or buying. The system should be informative enough that user know what they are submitting.
3. We need to solve the problem that after submitting the order, the system would not automatically redirect to the user history page.
4. The user history page needs to automatically update instead of needing manually refresh it.
5. The user history page needs to show the total order and the current process.
6. We need to confirm with Andre about when does the trading market close.
7. After user submitted the order, they should still have the option to cancel the order.
8. If user login today, they should be able to see their yesterday's order.
